

Raku-phalt

Raku-phalt

Technology Overview

Raku-phalt is the reaction-curable cold asphalt mixture for repairing asphalt pavement.

It has faster strength development and higher durability than typical cold mixtures (volatile type).

Applications

- Repair of light- to heavy-traffic roads
- Repair of potholes
- Eliminating surface faulting
- Backfilling of core-sampling points

How to Use

Prepare gloves, brooms, shovels, etc.

Prepare the required amount of water (kettle, watering can, plastic bottle).

- Clean the area.
Remove pebbles, debris, etc.
- Put the required amount of material into a pothole.
- Level the material with a shovel, etc.
Add material 30% thicker.
- Pour water before compaction.
The amount of water used is approximately 1 liter per 20kg/bag.
- Immediately after watering, the material should be compacted with your foot or the back of a shovel.
- In areas with heavy traffic, the material should be compacted using a plate compactor, etc.
